# Inclusive jets & exclusive central particle production at the Tevatron

---

Ronan McNulty

(University College Dublin)

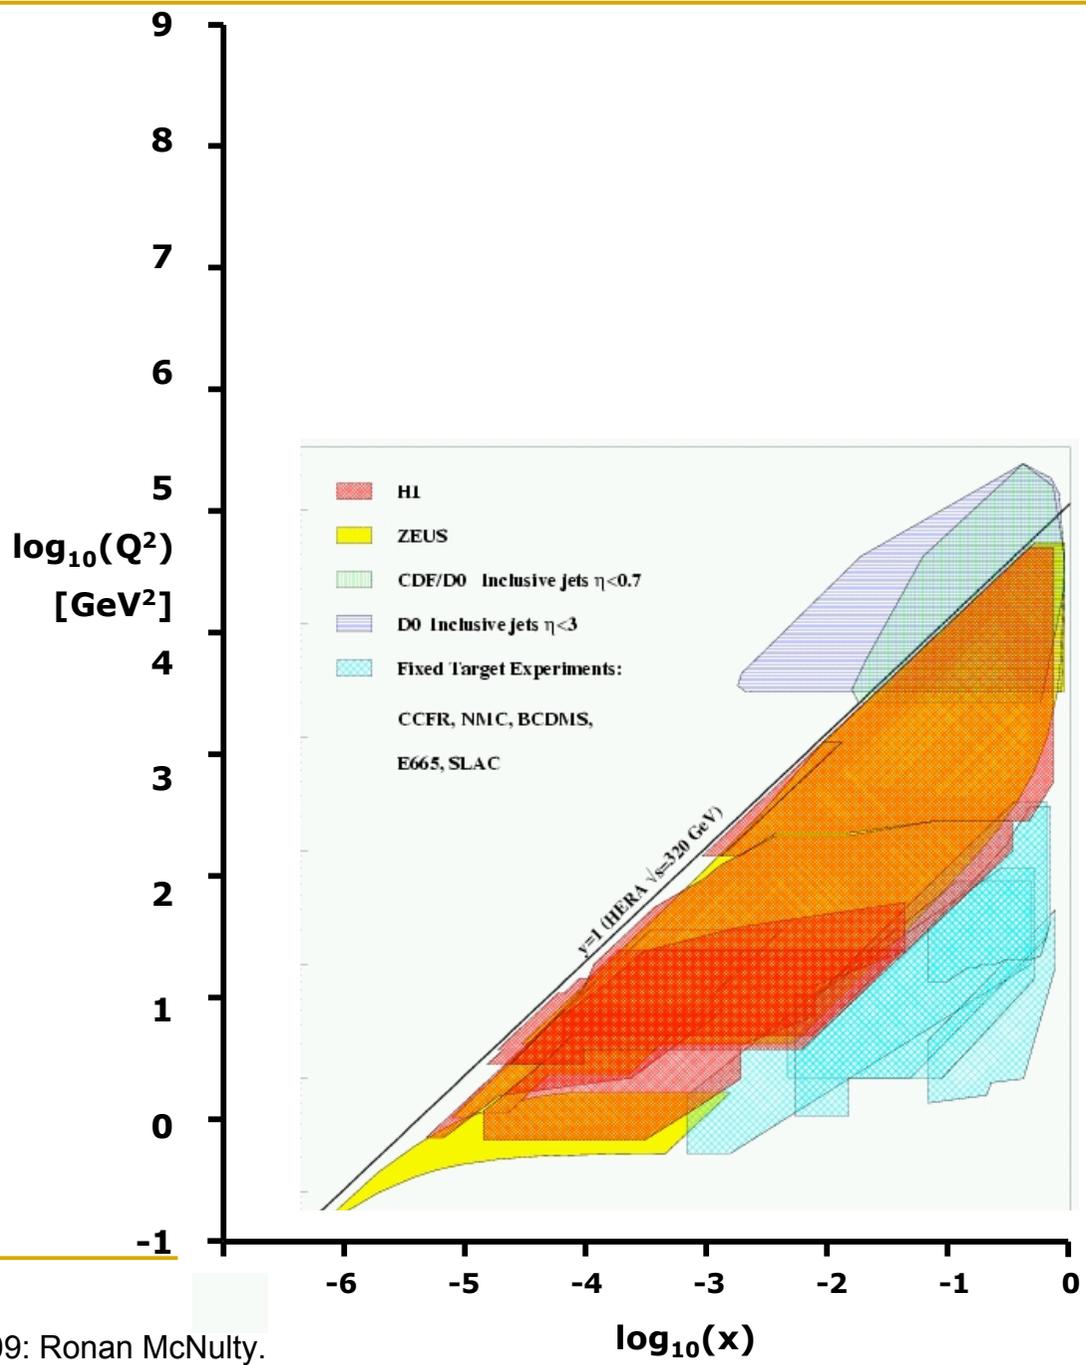

on behalf of the CDF collaboration.

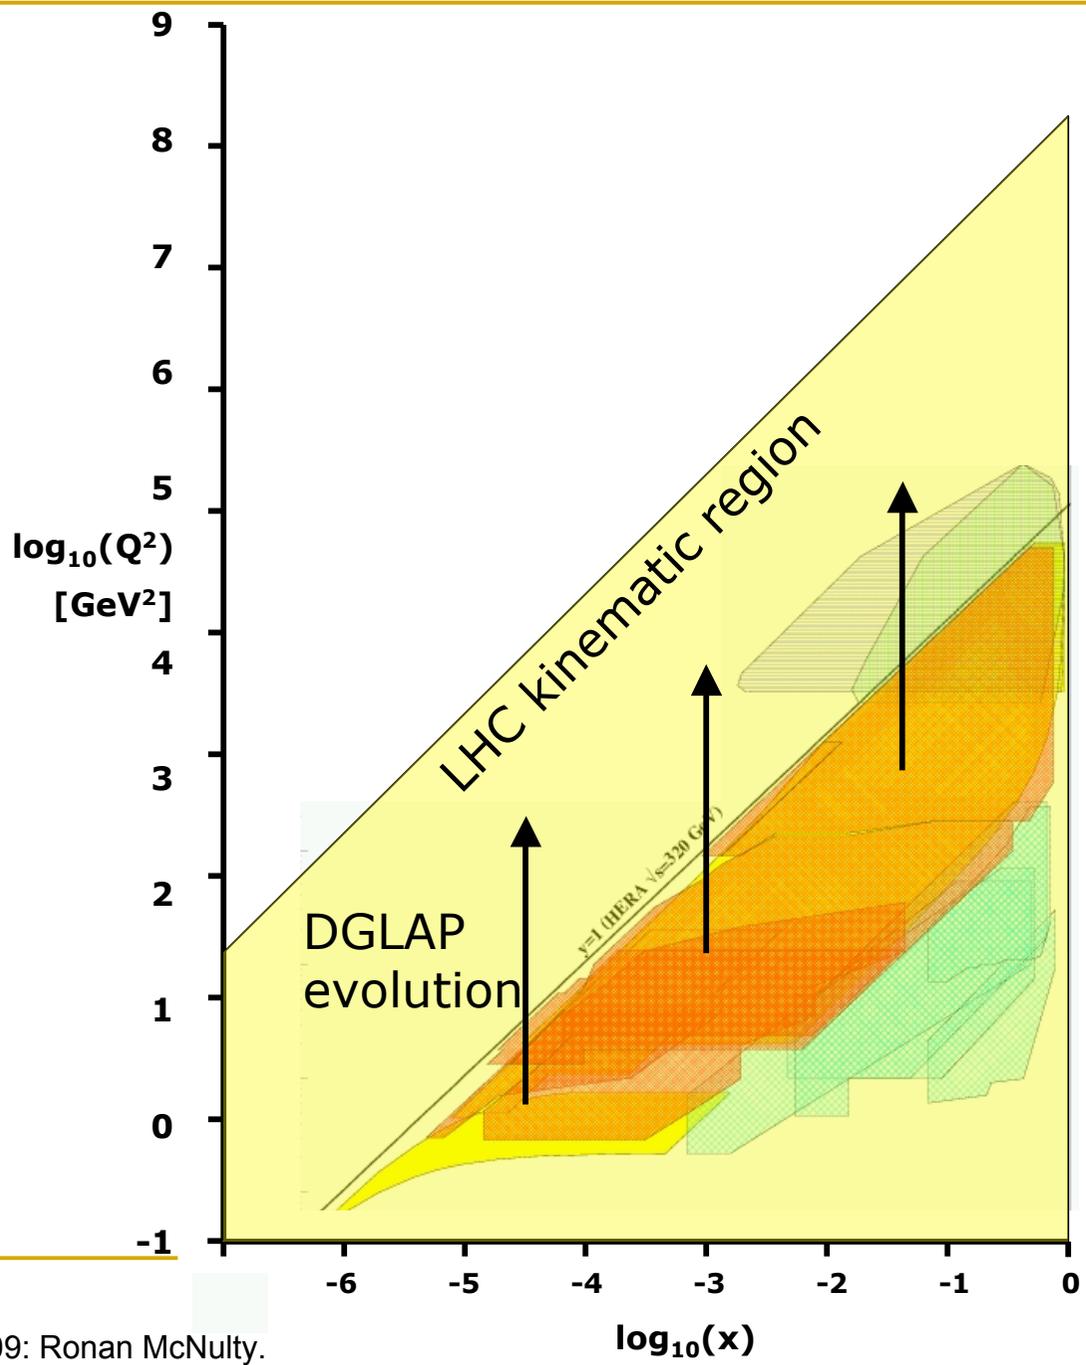

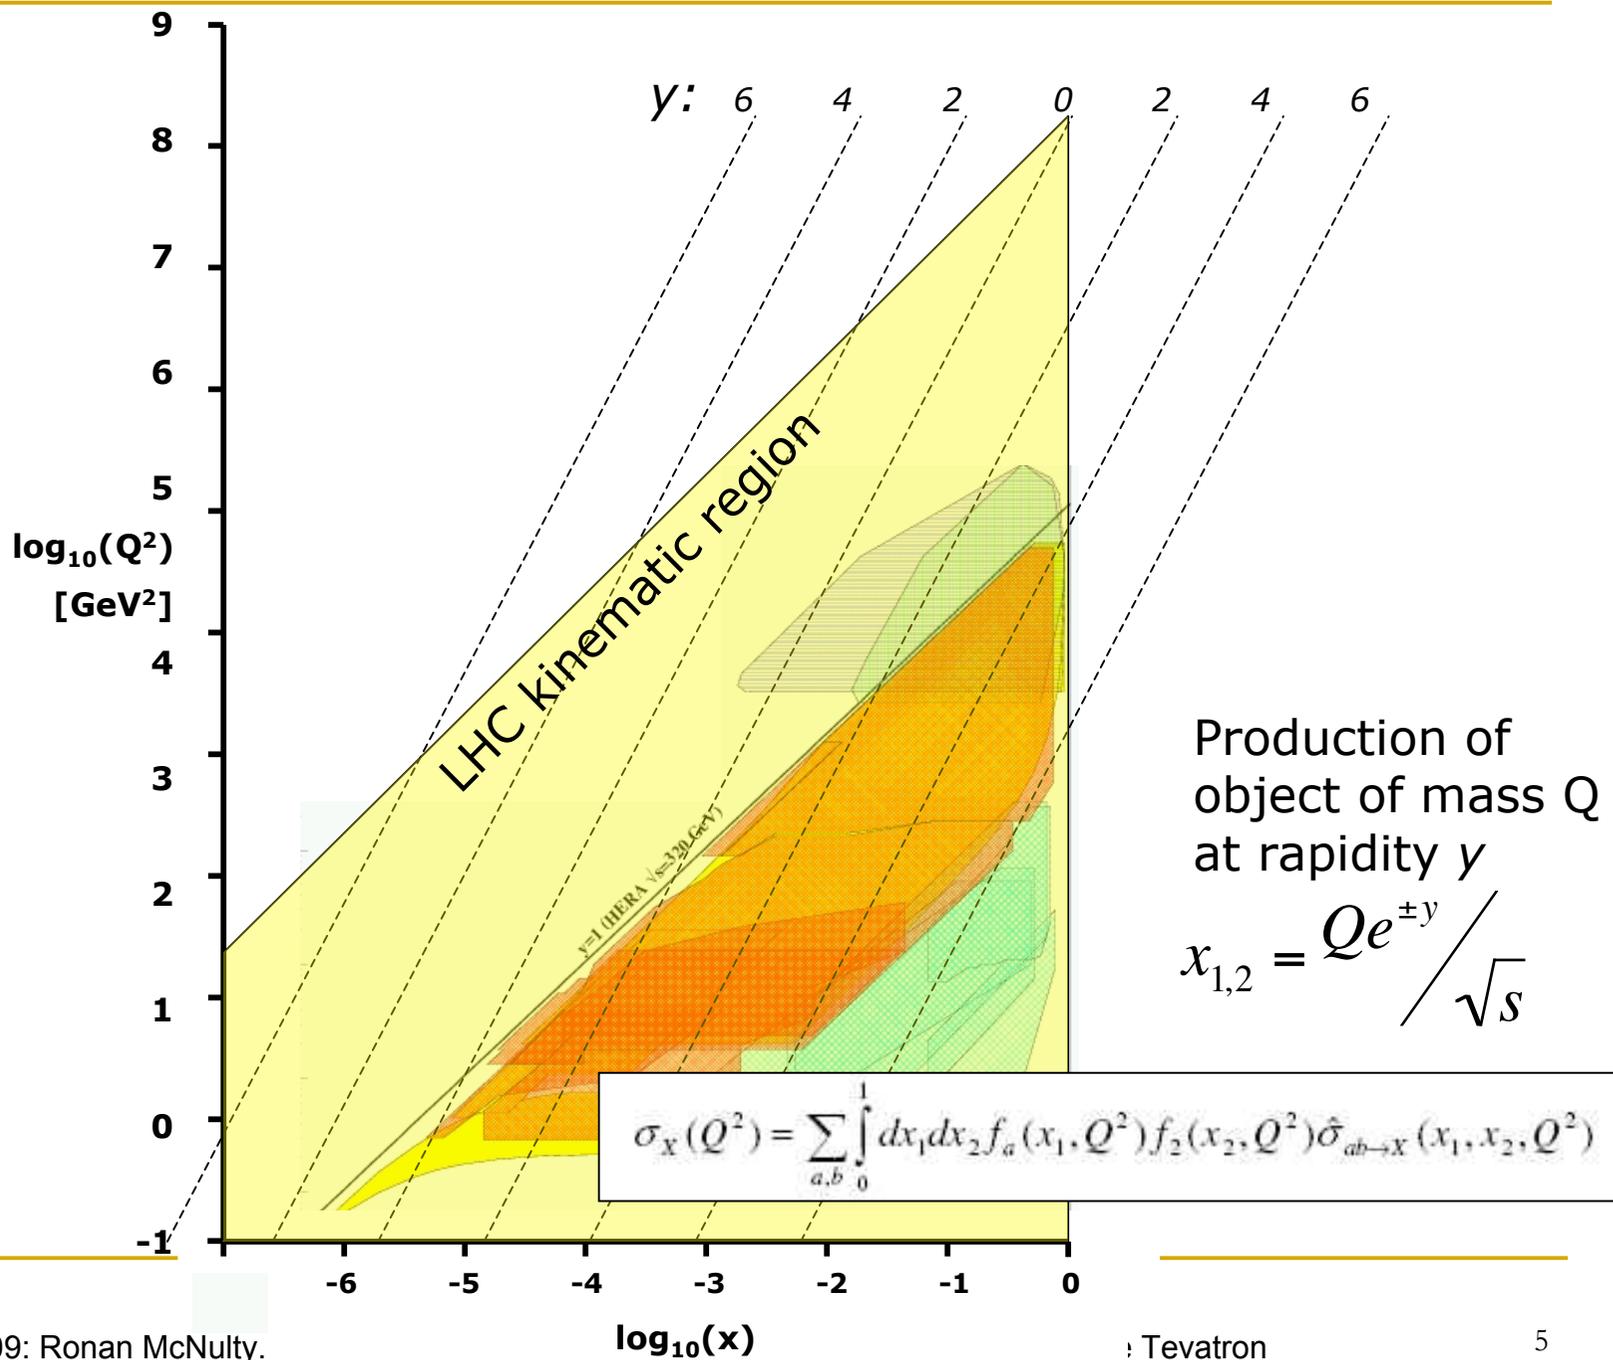

---

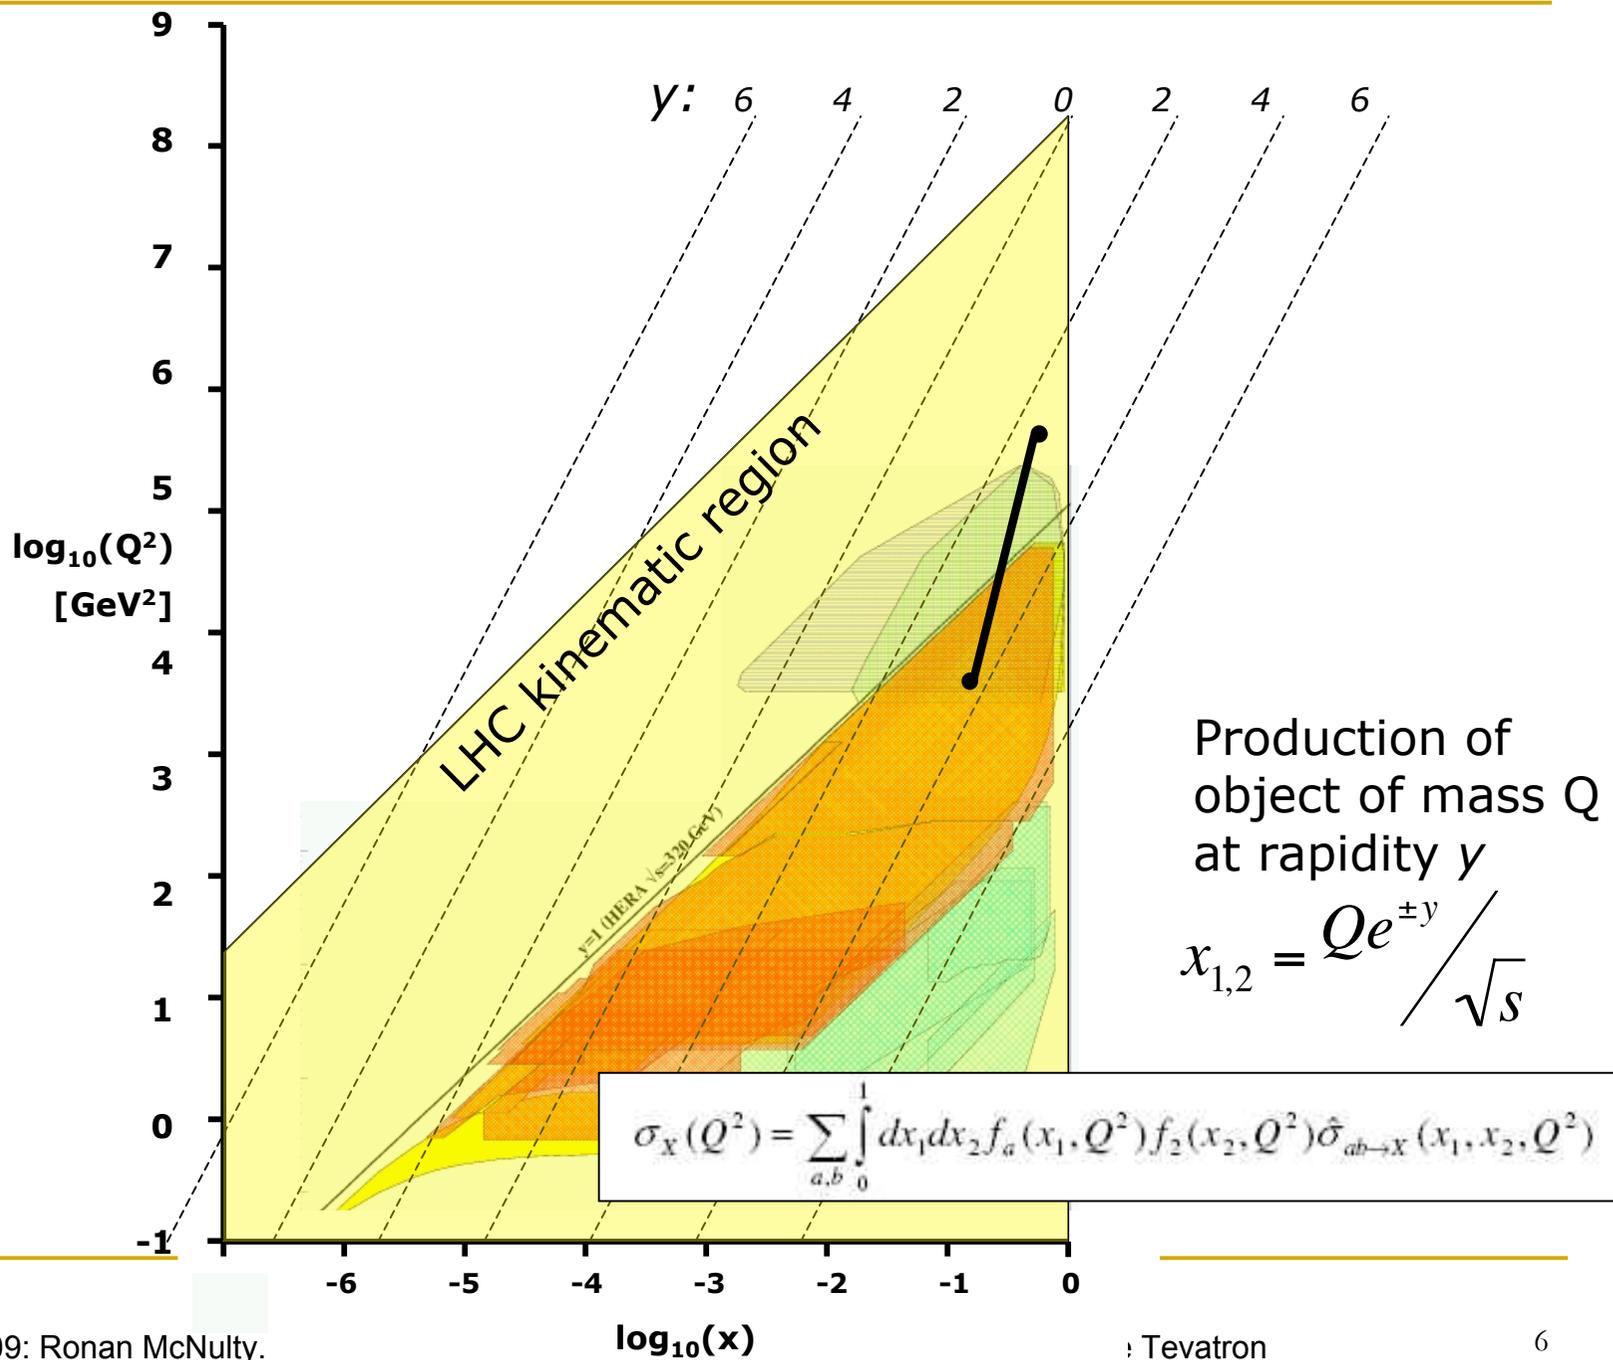

# Inclusive Jets (see also talk by [M.Martinez-Perez](#))

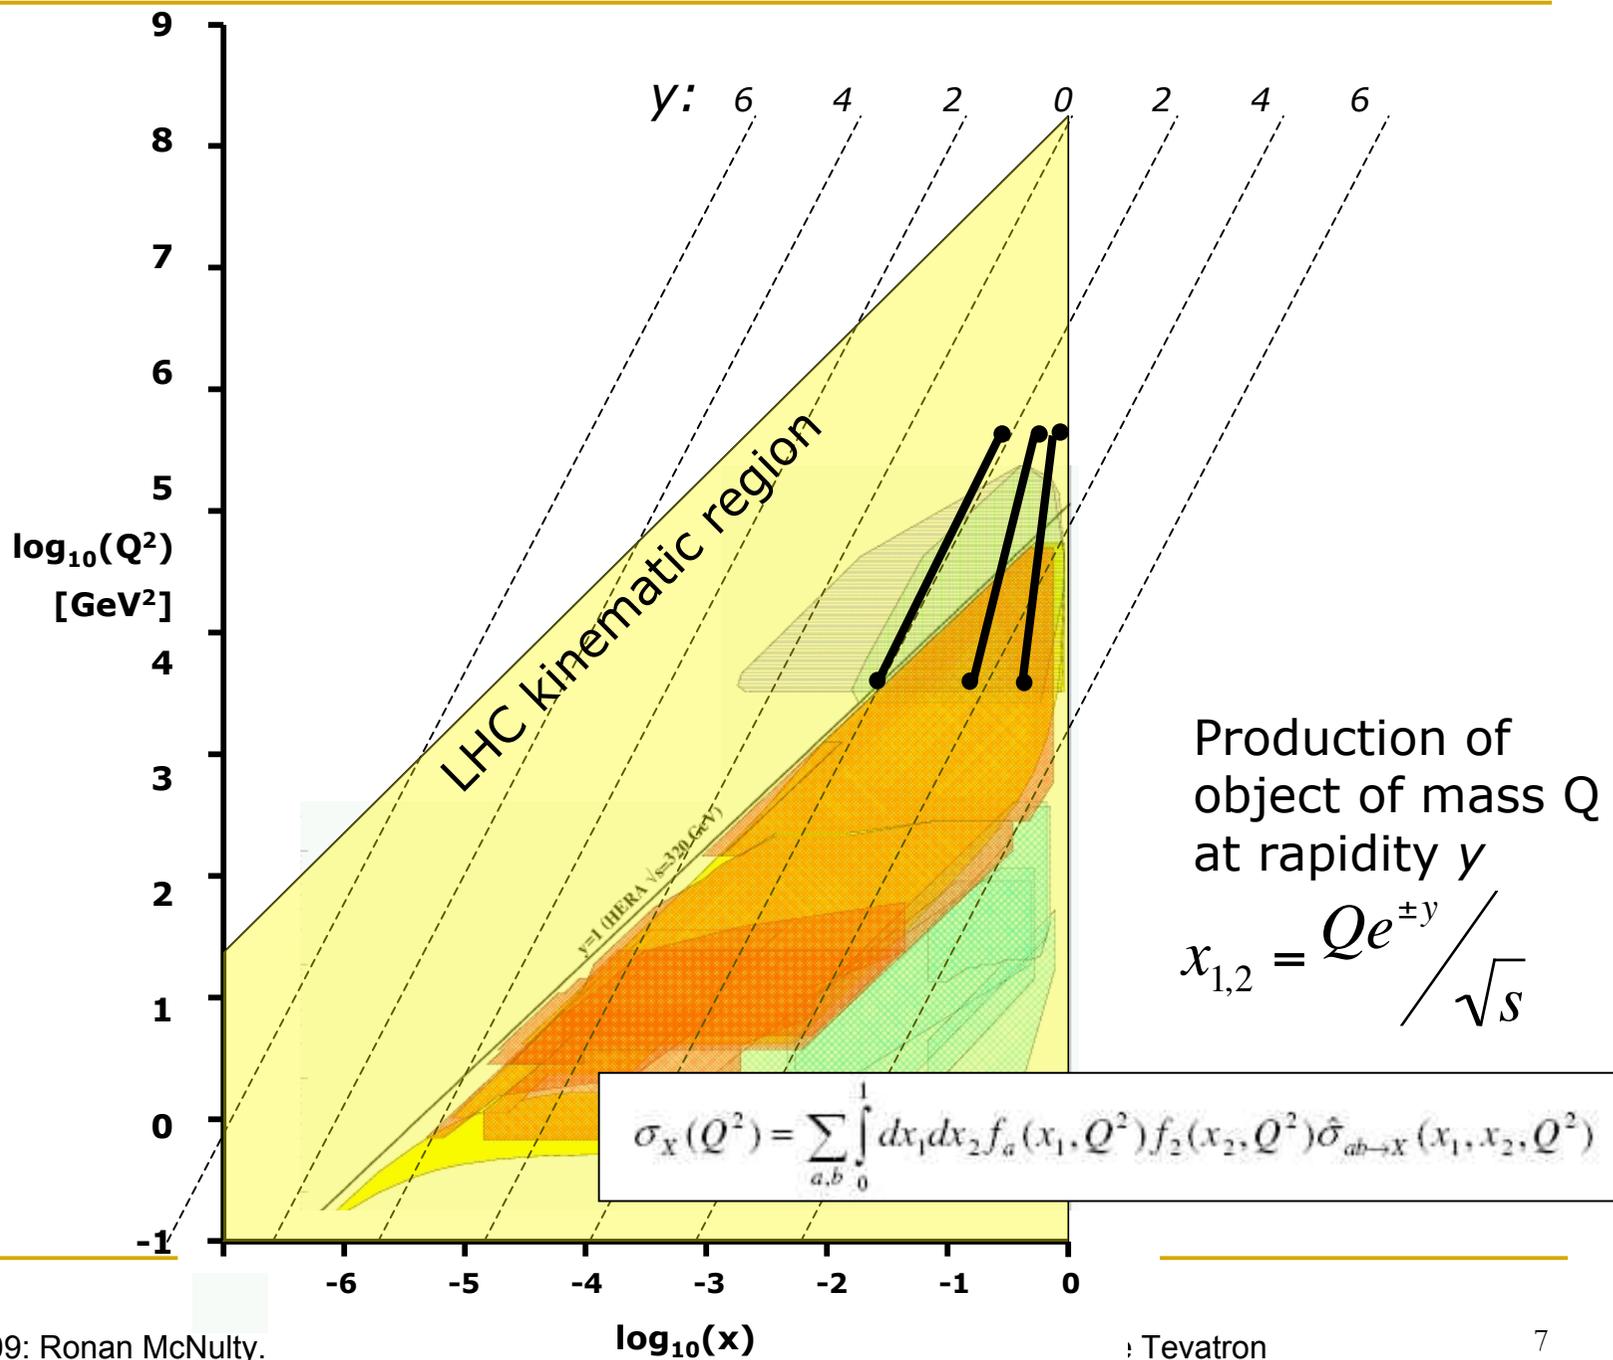

- Constraining the PDFs (high-x gluon)
  - To describe Standard Model physics
  - To discover New Physics
- How to measure at the Tevatron
  - kT algorithm ( $1.1\text{fb}^{-1}$  of data)
  - midpoint cone algorithm ( $1.0\text{fb}^{-1}$  of data)
- What it says about PDFs.

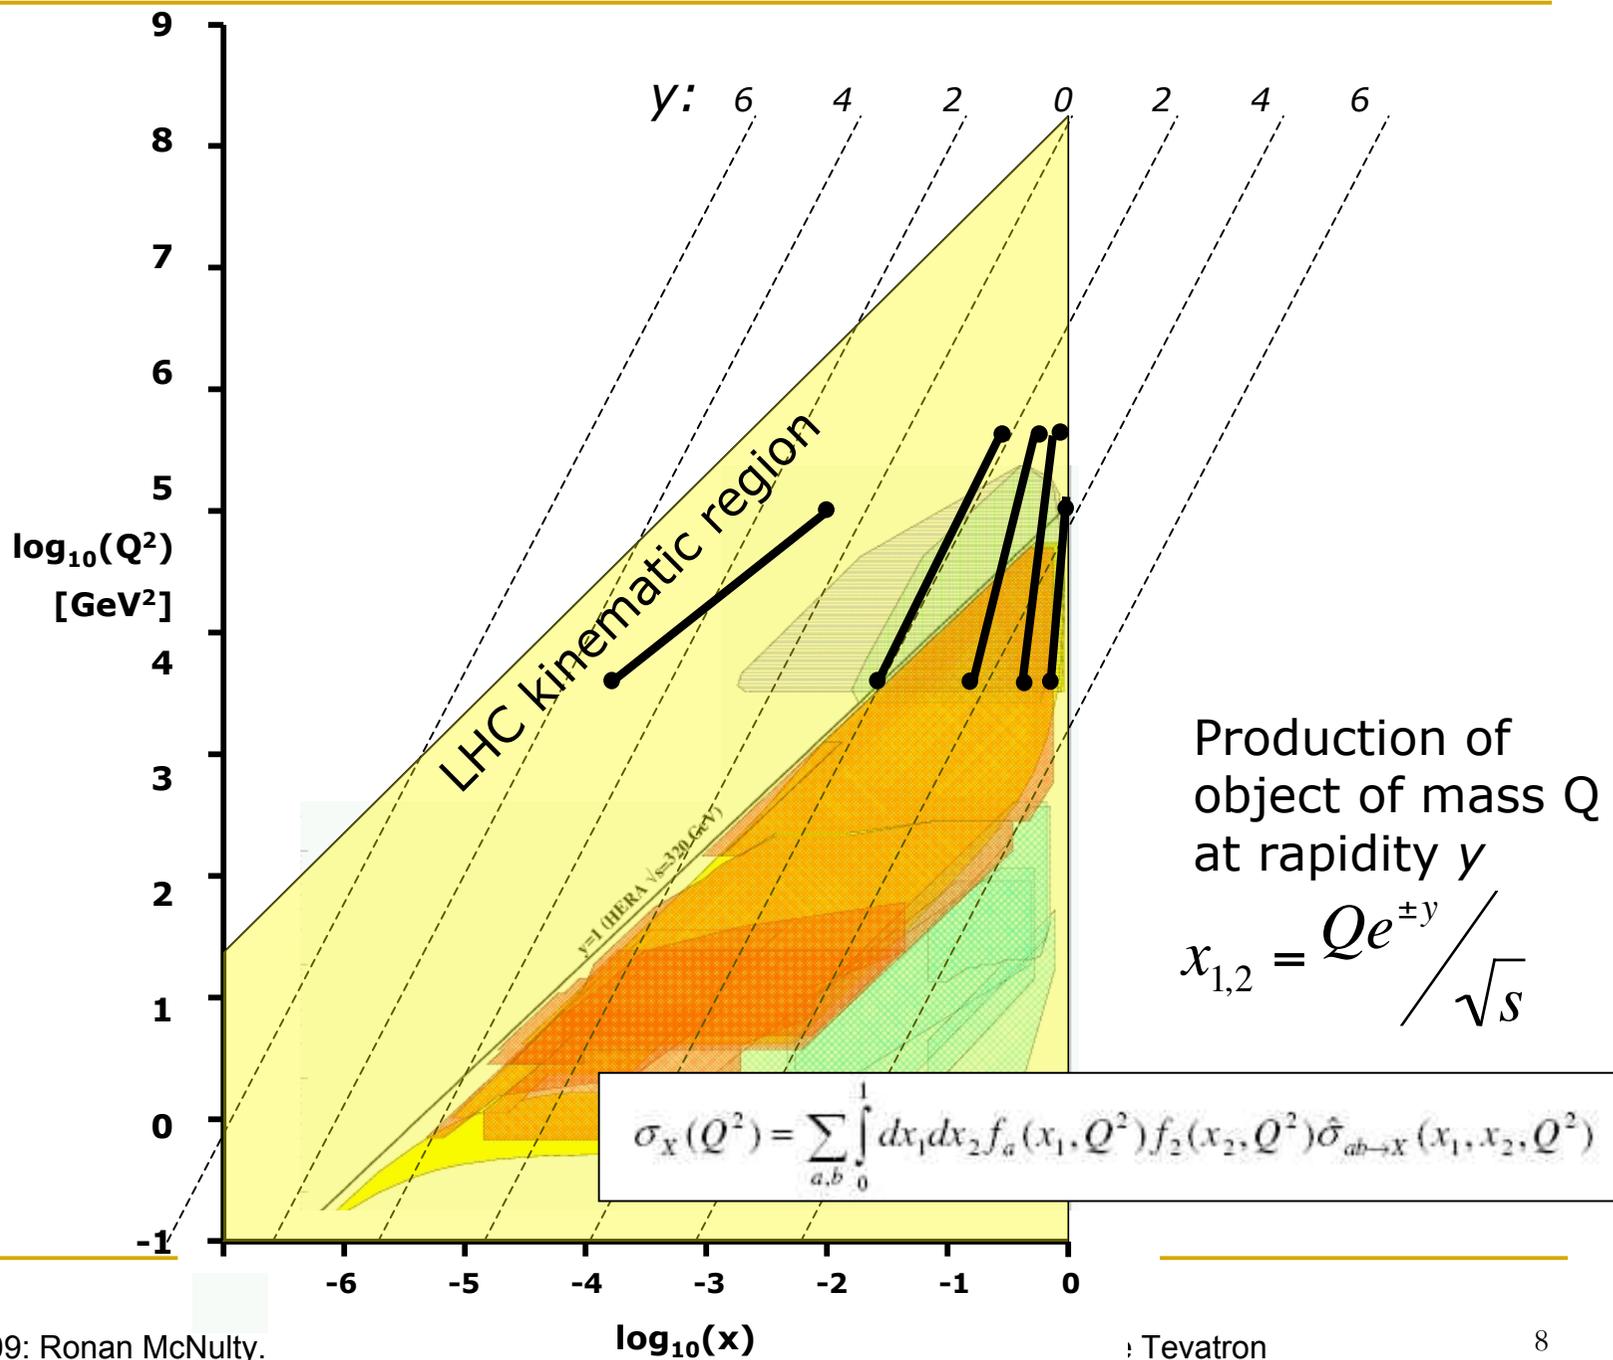

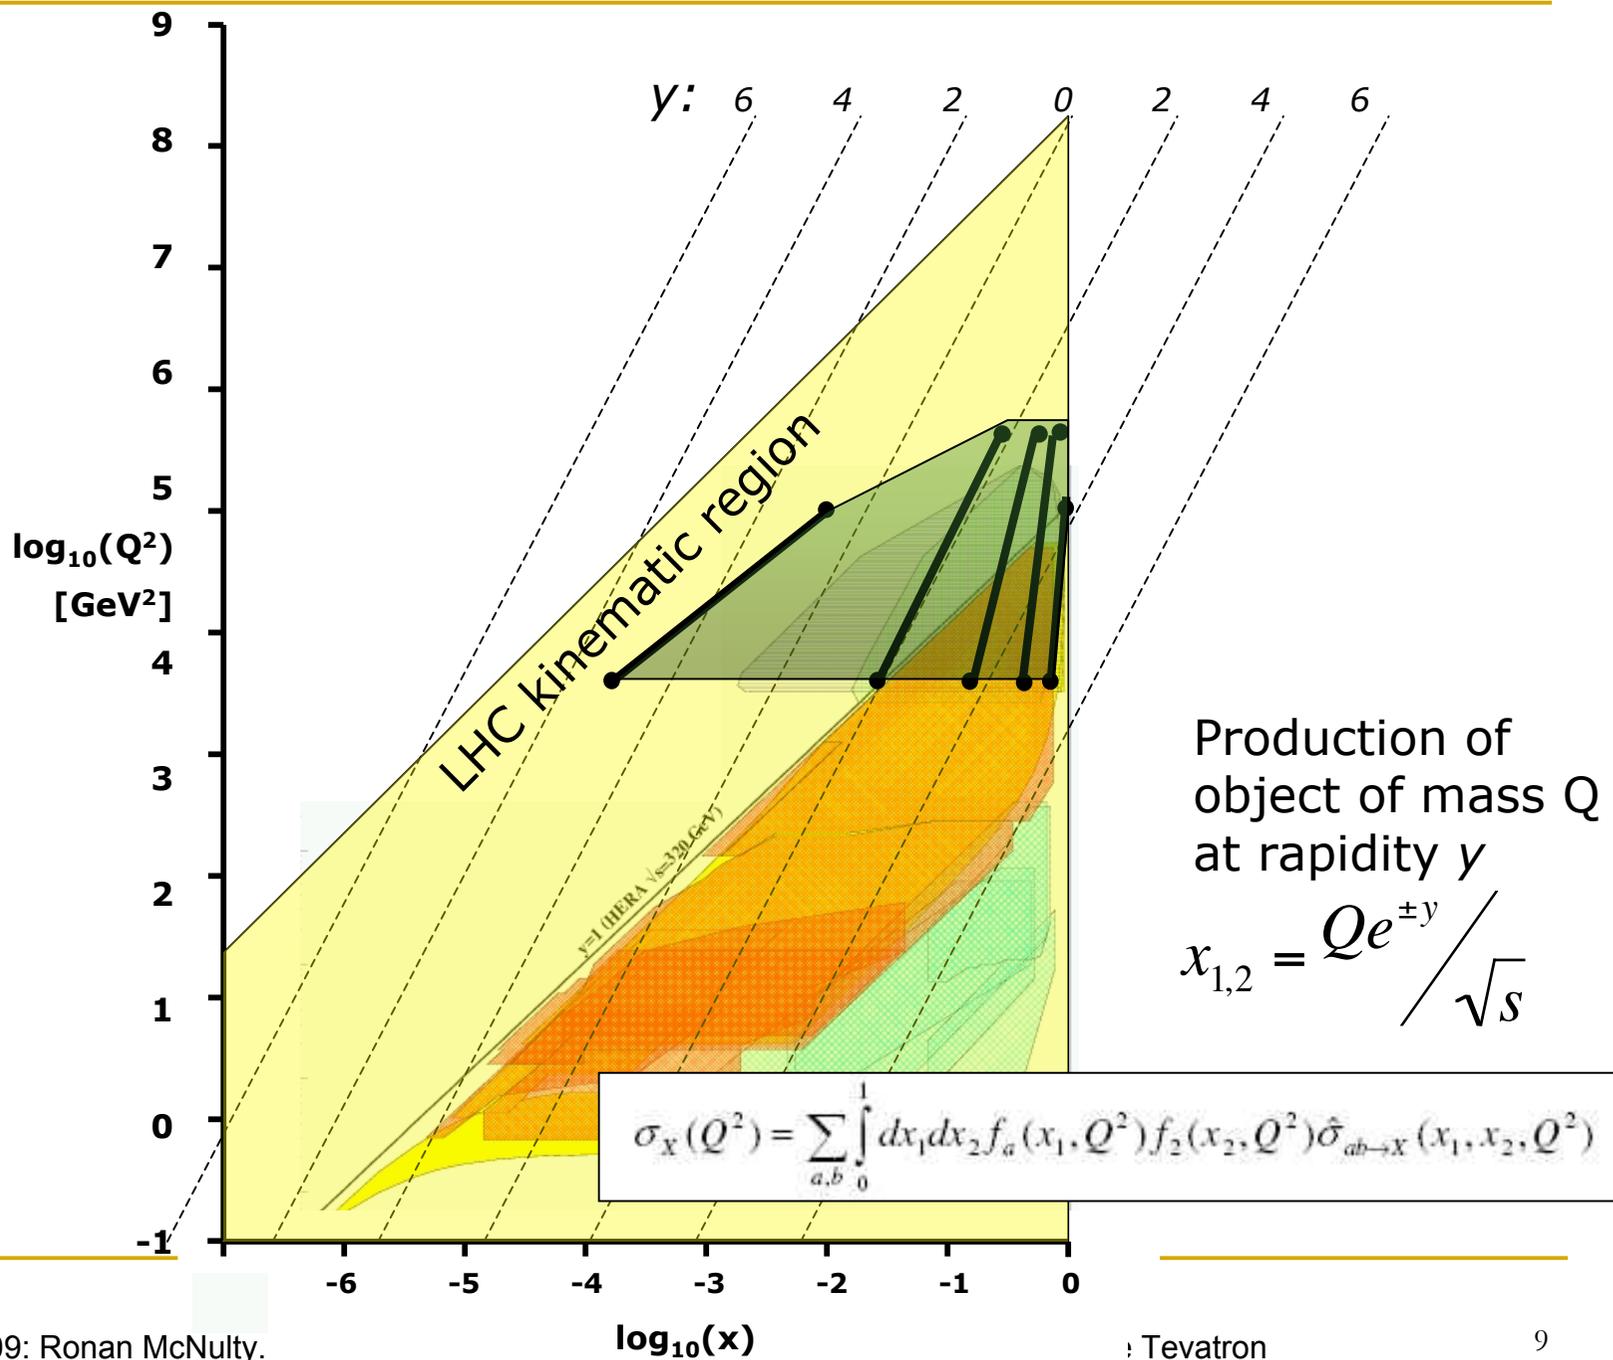

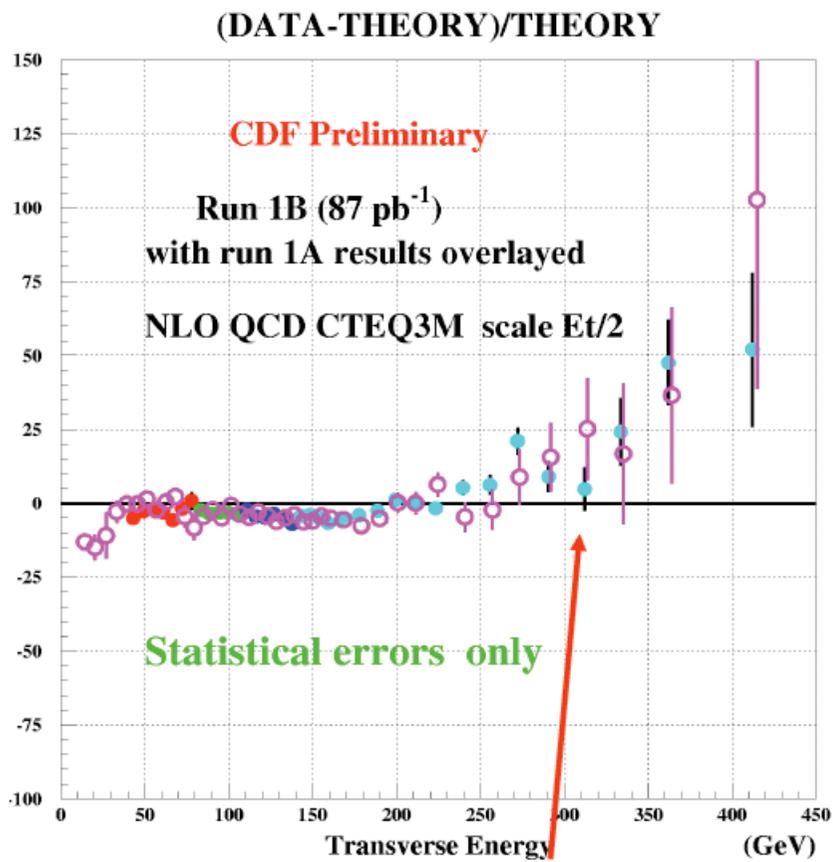

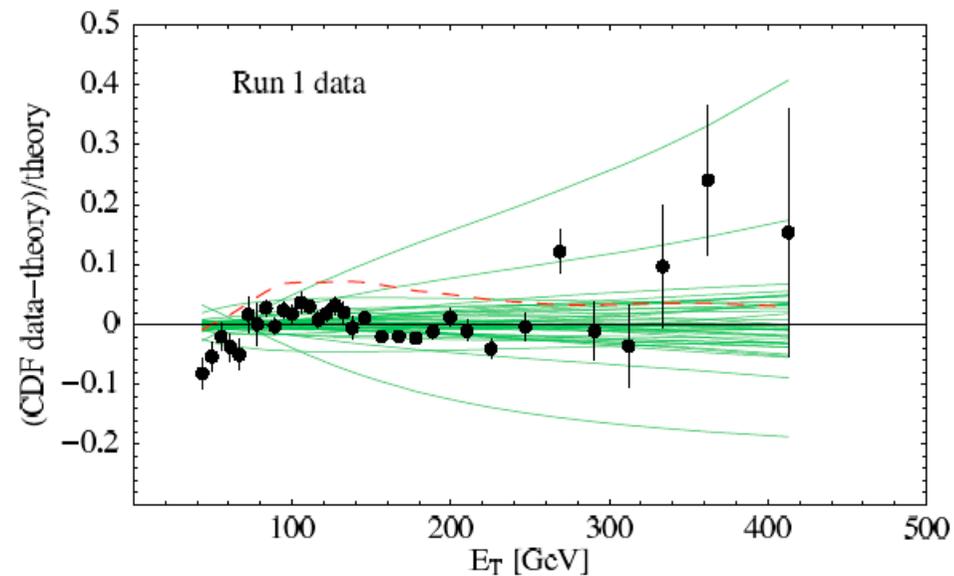

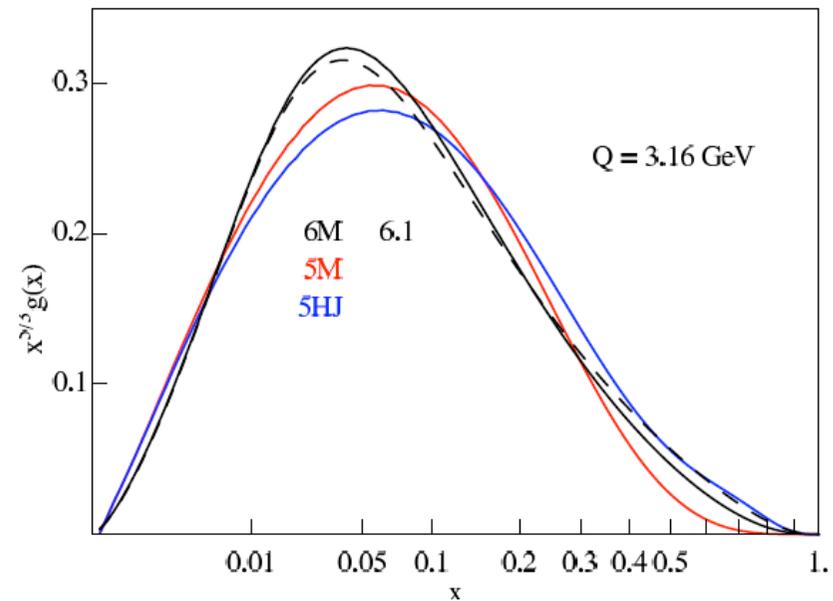

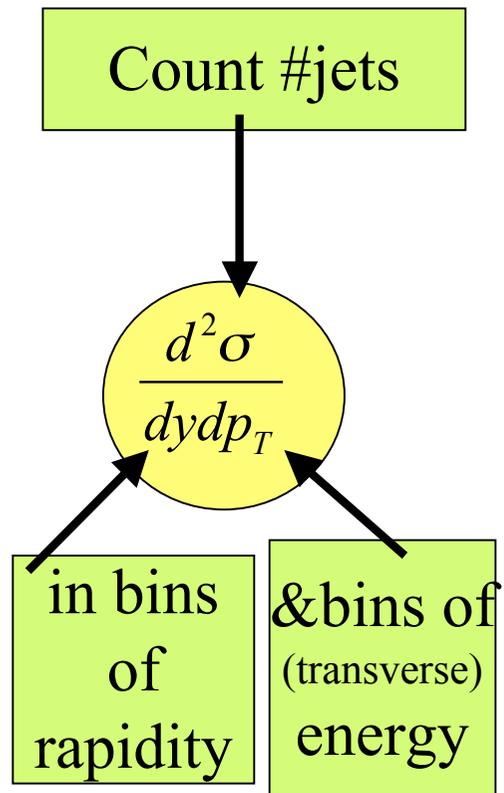

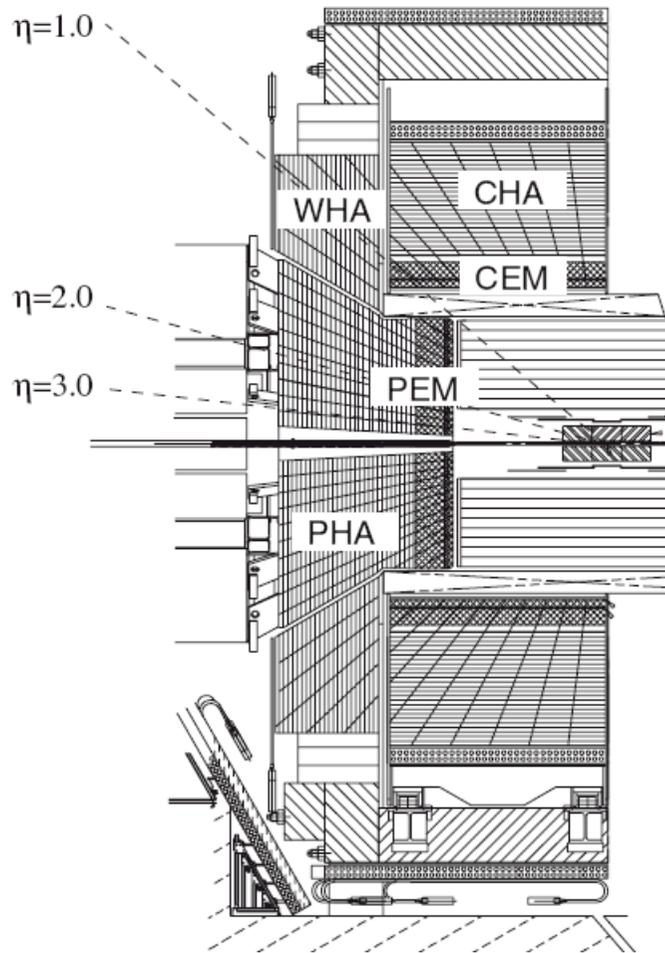

Was this new physics?

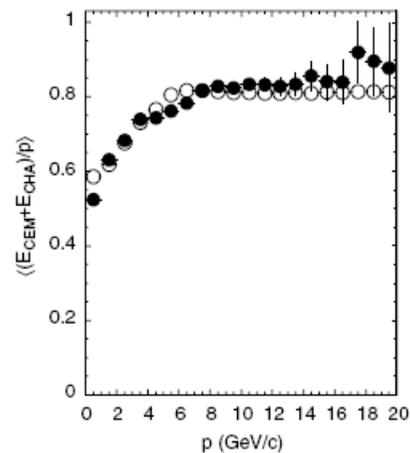

# Methodology

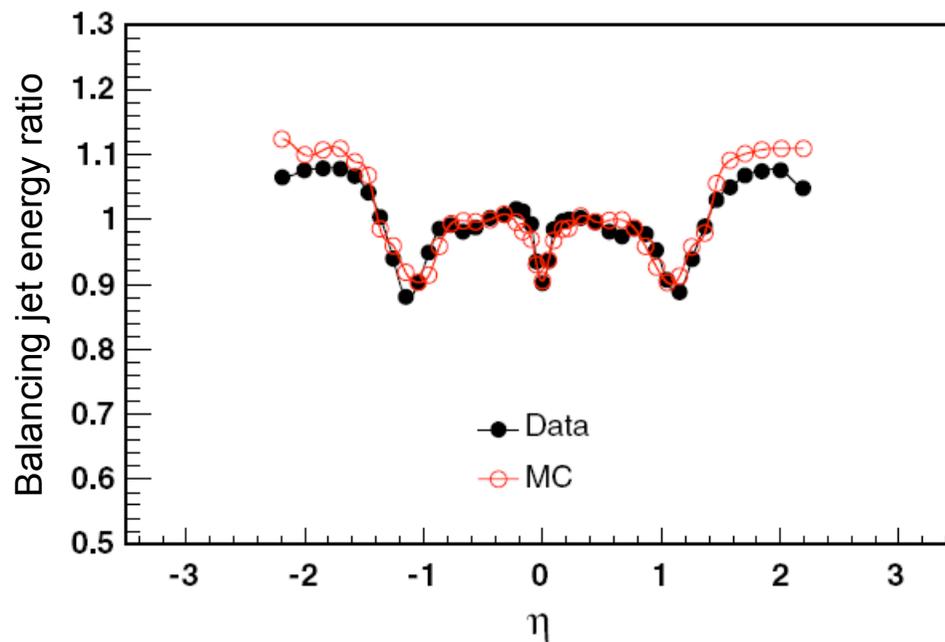

Energy fraction in calorimeter

● data  
○ mc

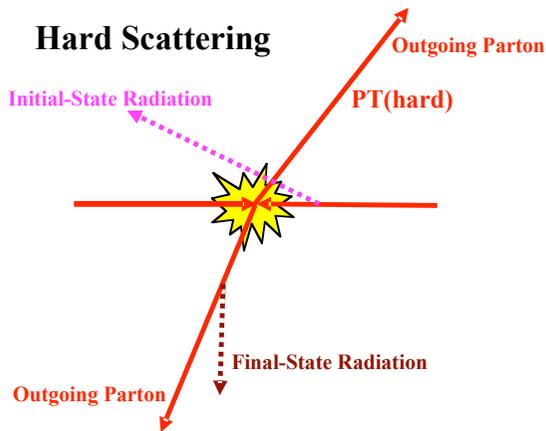

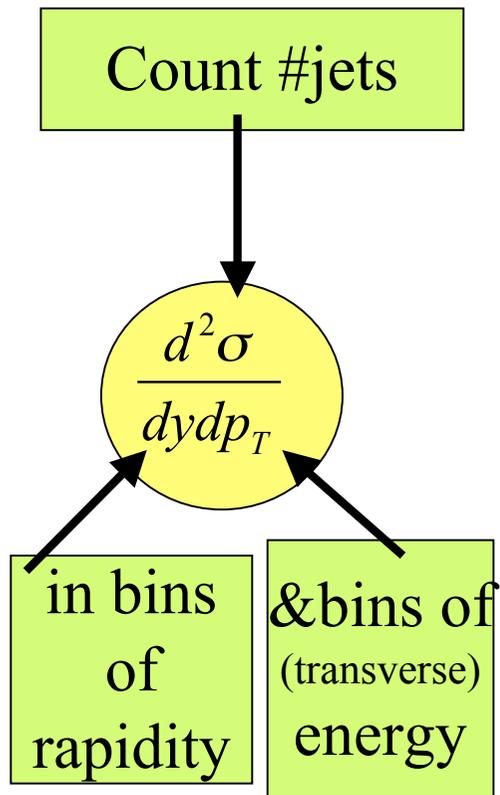

2-3% systematic

single track momentum

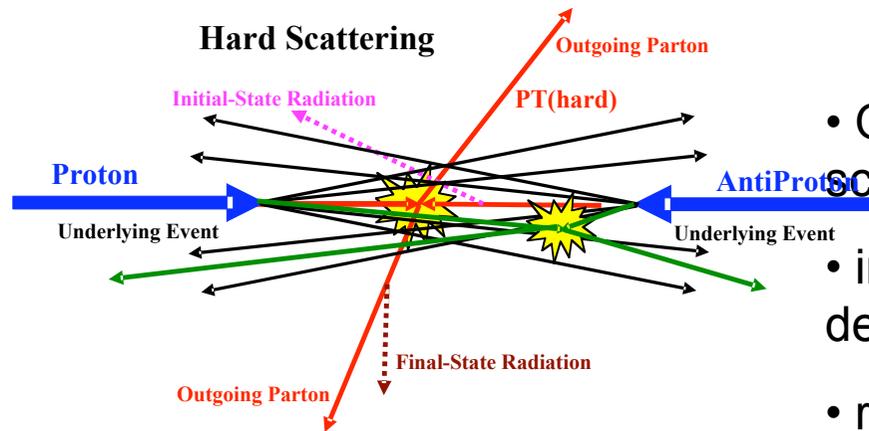

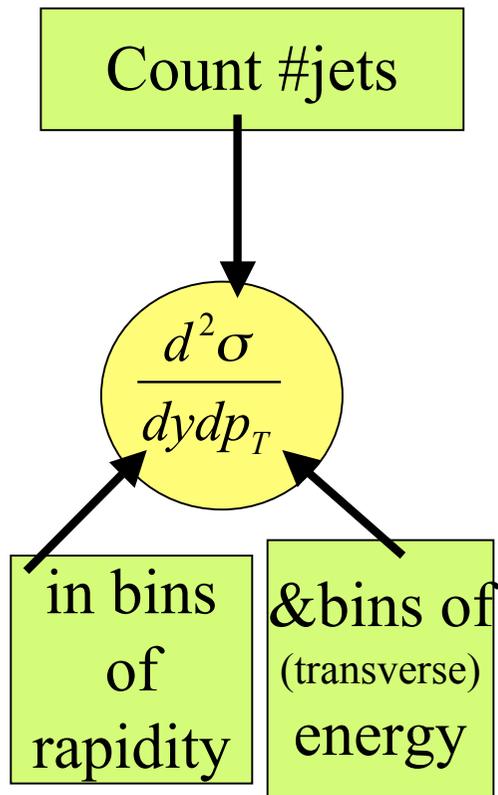

● Data  
○ MC

# Methodology

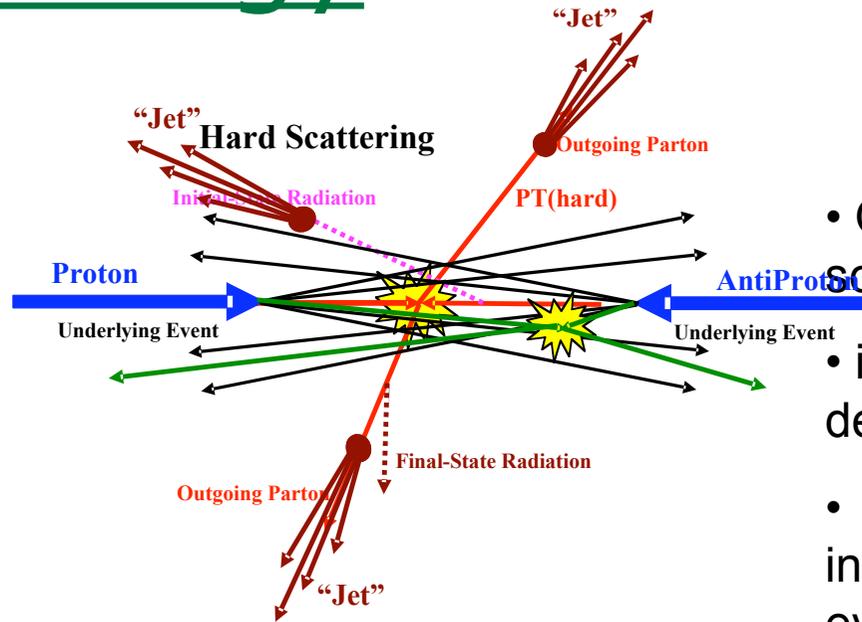

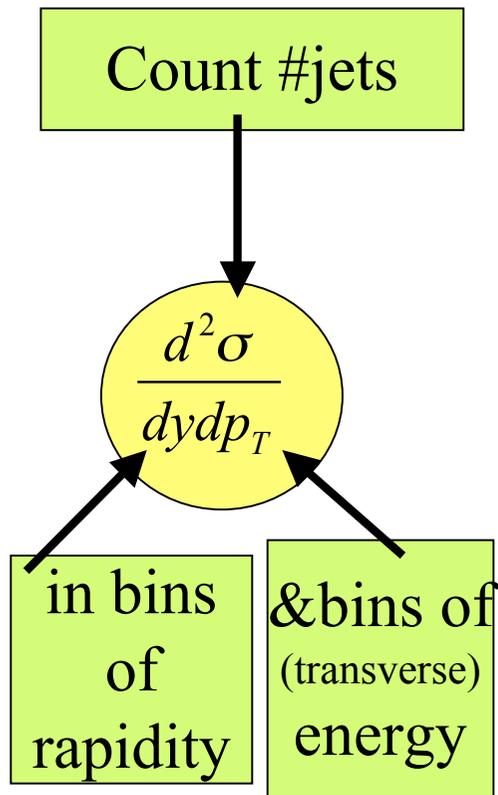

- QCD predicts hard scatter

# Methodology

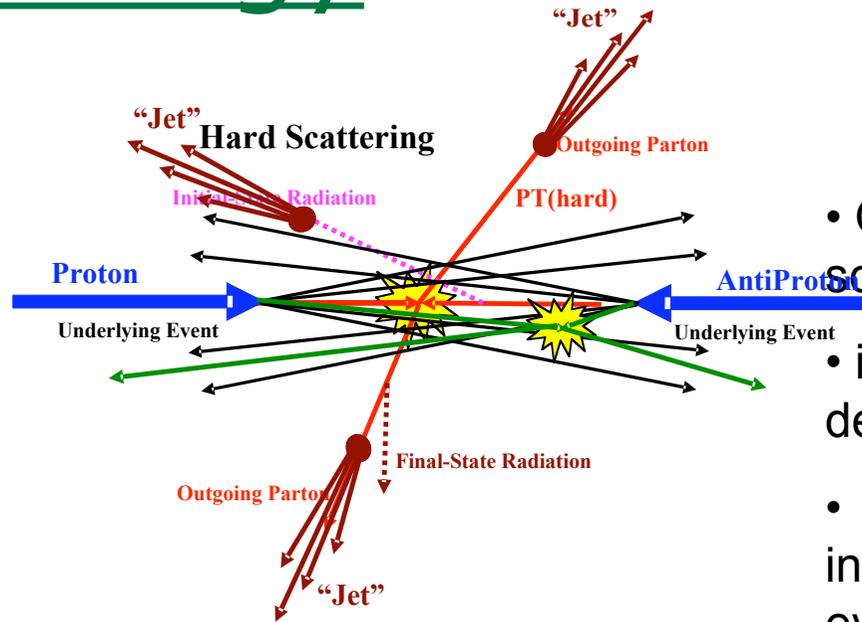

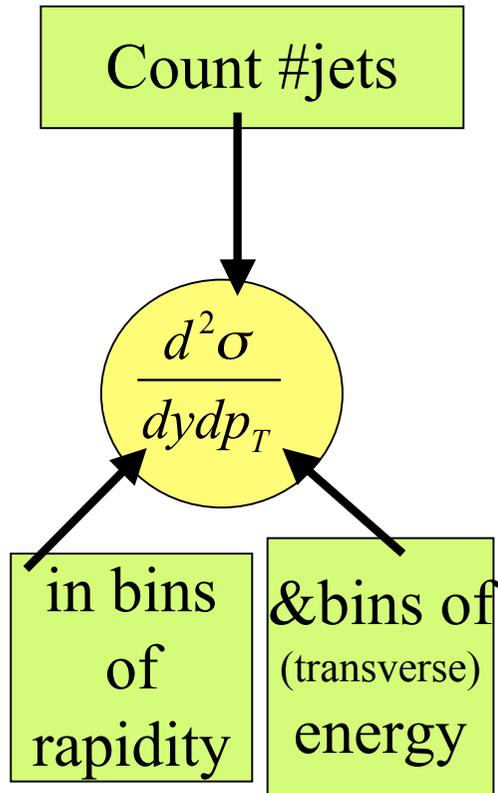

- QCD predicts hard scatter
- initial parton in proton described by PDF
- remaining partons interact (underlying event: proton remnants and mpi )
- multiple pp interactions

# Methodology

- QCD predicts hard scatter
- initial parton in proton described by PDF
- remaining partons interact (underlying event: proton remnants and mpi )
- multiple pp interactions
- Partons hadronise
- We measure energy
- Collect it into jets

# Methodology

- QCD predicts hard scatter
- initial parton in proton described by PDF
- remaining partons interact (underlying event: proton remnants and mpi )

Midpoint  
cone algorithm

$k_T$  algorithm

## Calorimeter response

Midpoint  
cone algorithm

Jet Energy Scale: Nucl. Inst. Meth. 566 (2006) 375–412

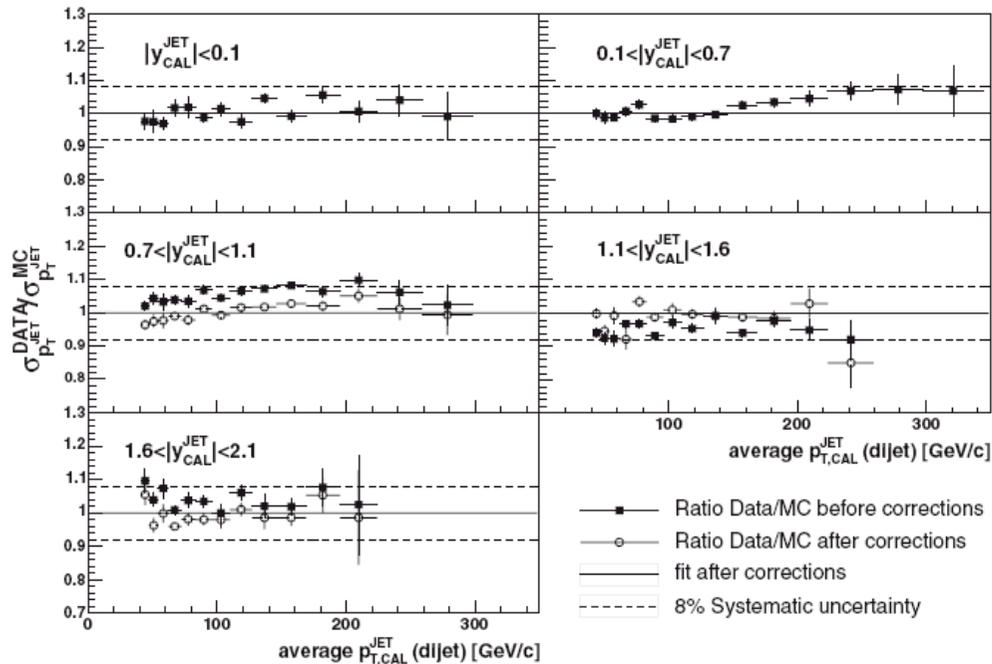

Systematic: 10%  $\rightarrow$  60% on cross-section measurement.

(larger at high pt)

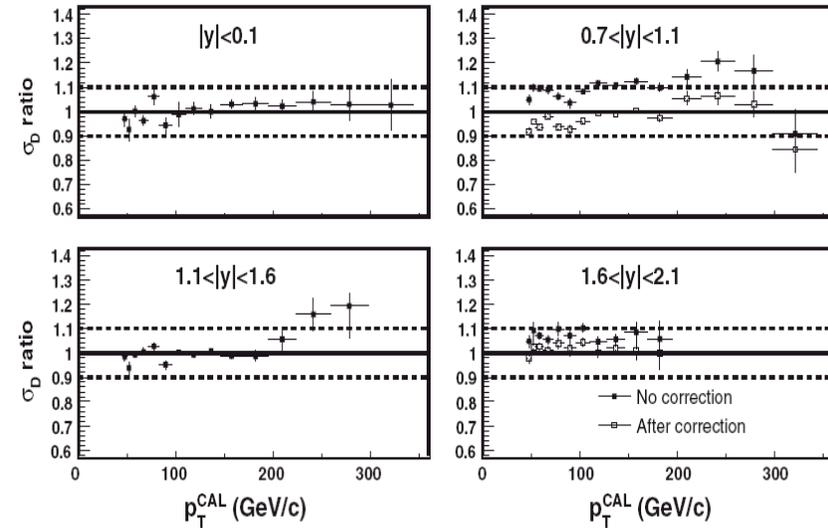

$k_T$  algorithm

Calorimeter resolution

Midpoint  
cone algorithm

$$\sigma(\text{CEM}) = 14\%/\sqrt{E} + 2\%$$
$$\sigma(\text{CHA}) = 50\%/\sqrt{E} + 3\%$$

Systematic: 10%  $\rightarrow$  2% on cross-section measurement.

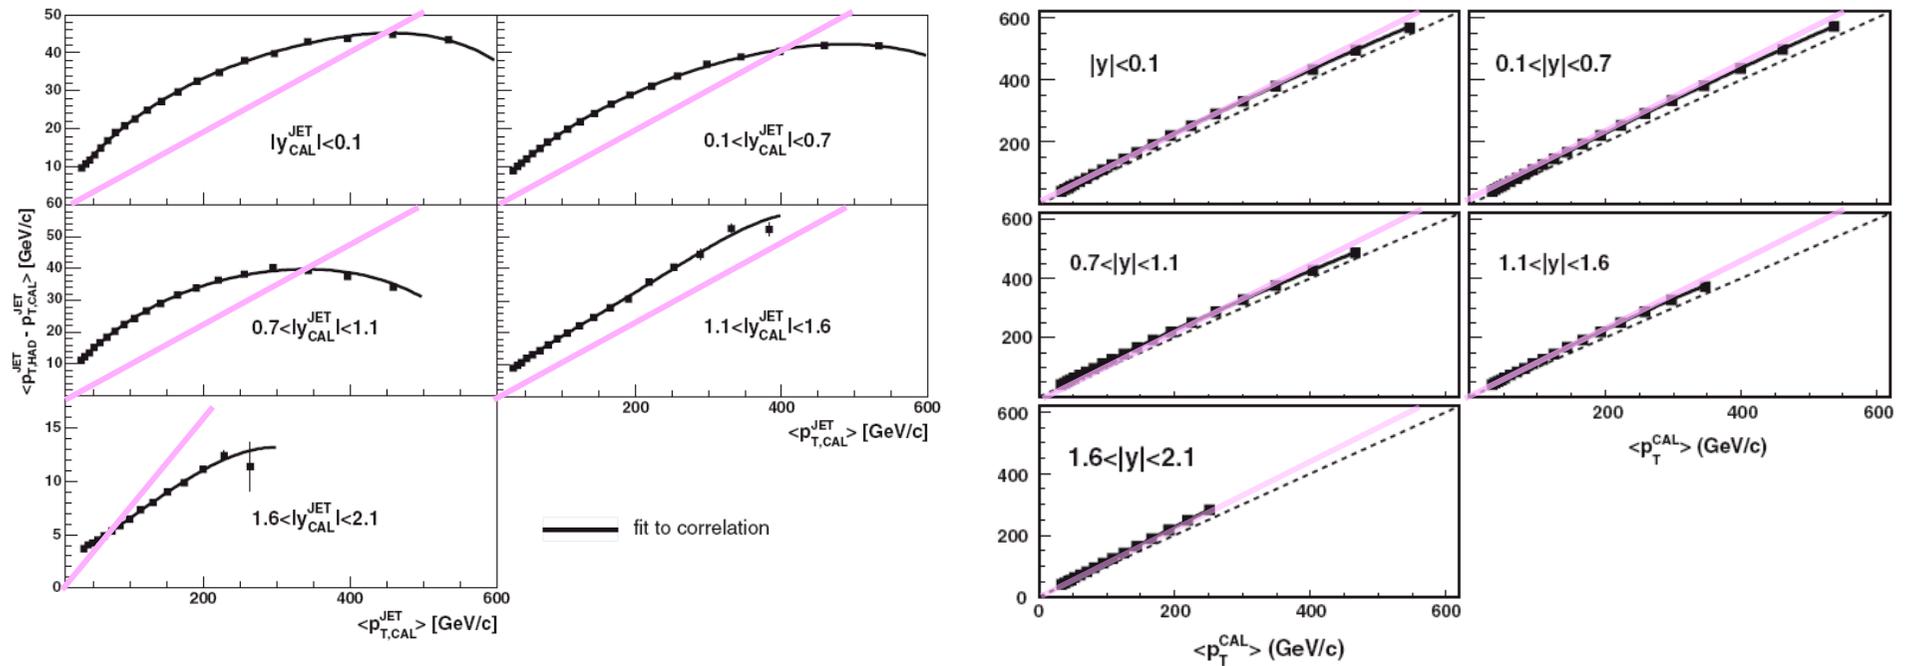

(smaller at high pt)

$k_T$  algorithm

Unfolding to  
hadron level

Midpoint  
cone algorithm

Correct for energy missing from defined jet (calorimeter response / out-of-cone energy)

Systematic: 1%  $\rightarrow$  10% on cross-section measurement.

$k_T$  algorithm

Pile up

Midpoint  
cone algorithm

$\langle N_v \rangle = 1.5$  although  $N = 5.9$  at  $1.6 \times 10^{32} \text{cm}^{-2} \text{s}^{-1}$

$-1.86 * (N_v - 1) \text{ GeV}$

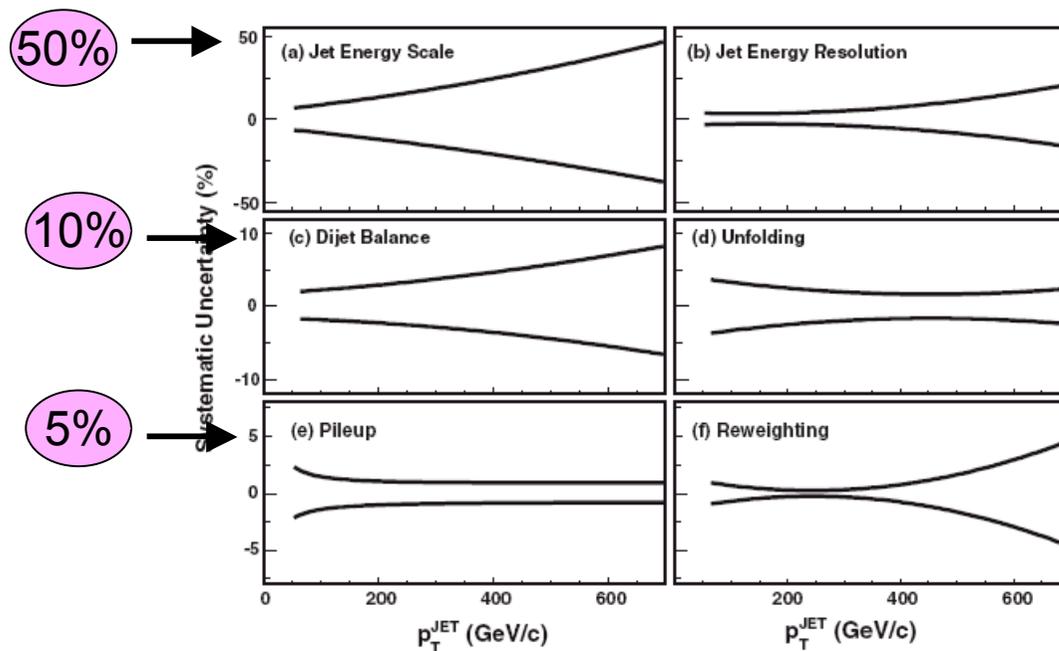

$-0.97 * (N_v - 1) \text{ GeV}$

Systematic: 0.5%  $\rightarrow$  2% on cross-section measurement

$k_T$  algorithm

## Systematic Overview

Midpoint  
cone algorithm

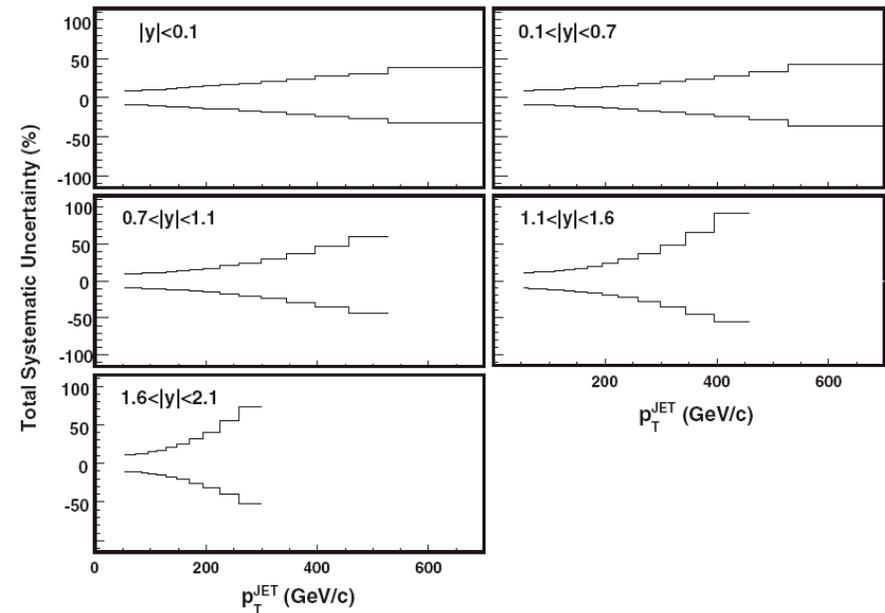

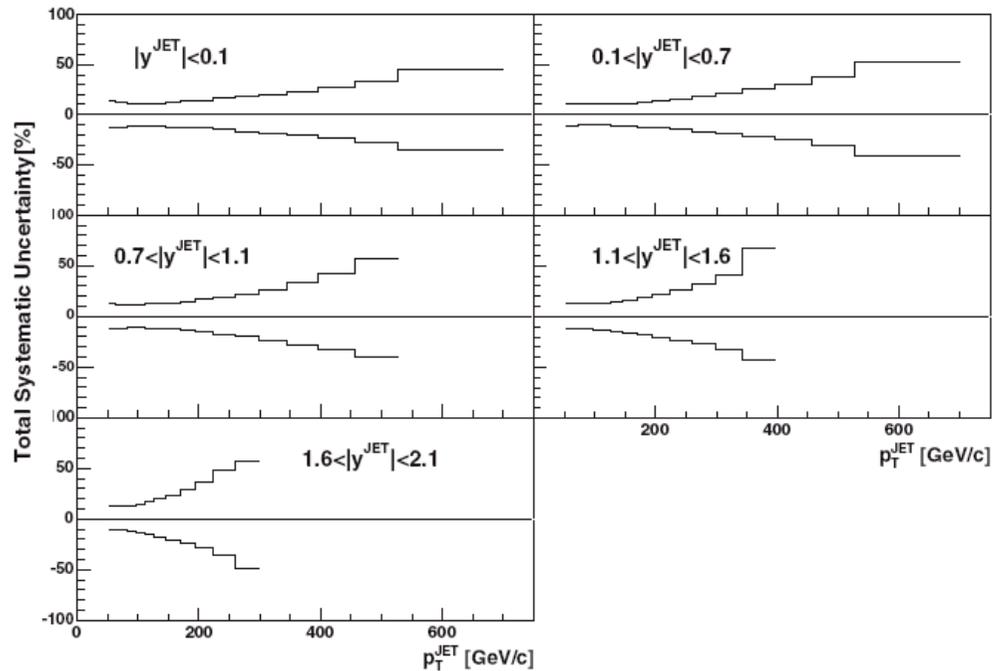

Jet energy scale dominates

$k_T$  algorithm

Total Systematics

Midpoint cone algorithm

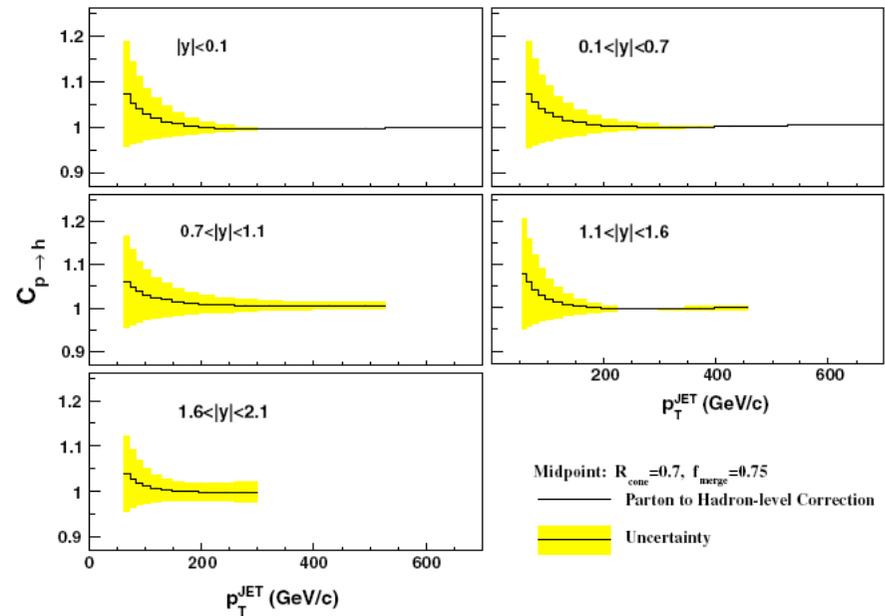

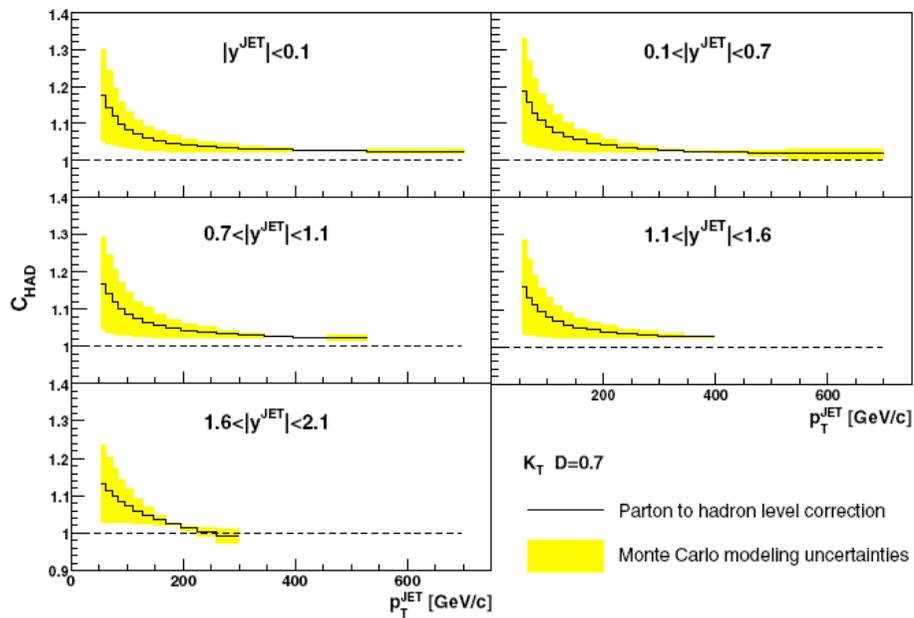

Total Systematic: Typically 10% at low  $p_T$ ; 50% at high.

hep-ex 0902.1271v3 (2009)

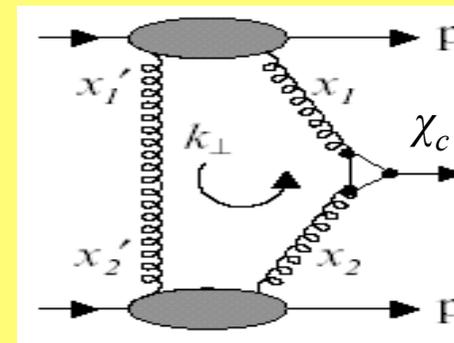

QED process: theory prediction  $< 1\%$

Luminosity candidate for LHC

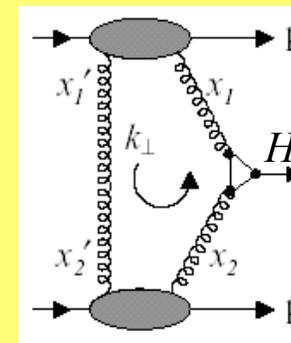

(See F.DeLorenzi's talk)

Possible odderon contribution

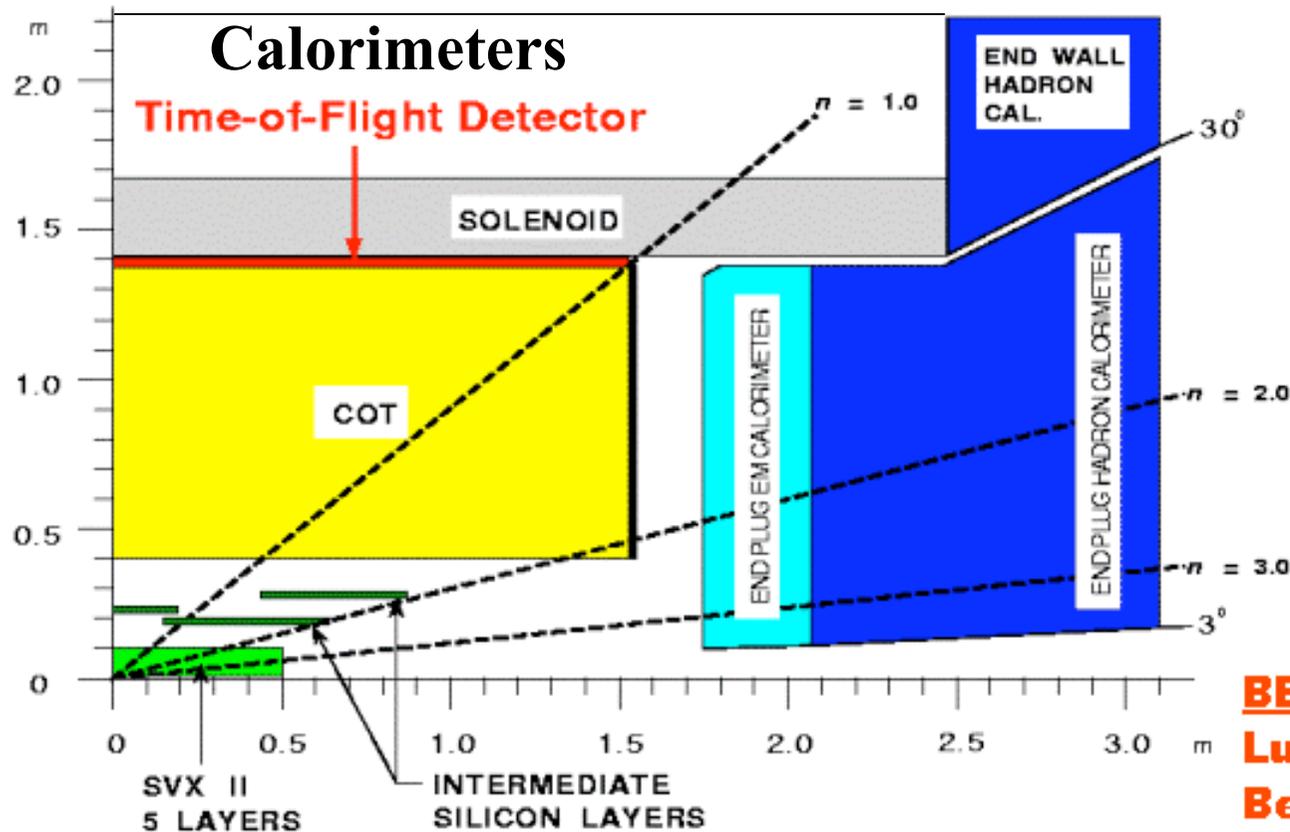

Calibrate of diffractive Higgs

## Muon Chambers

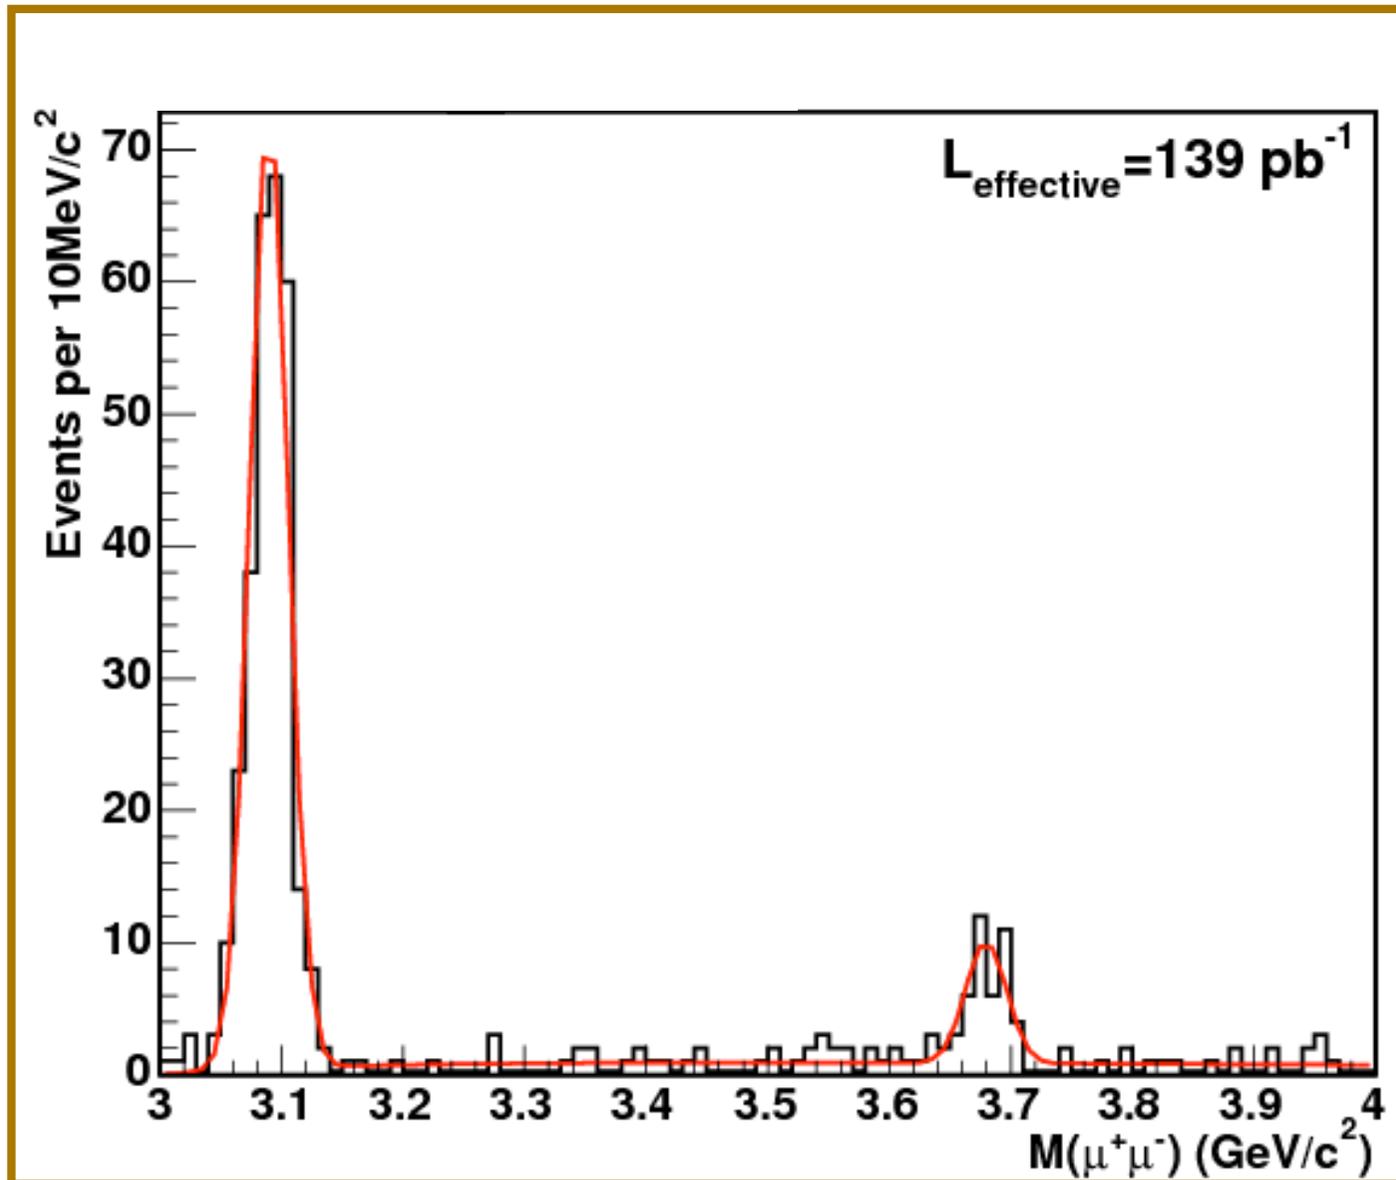

## Calorimeters

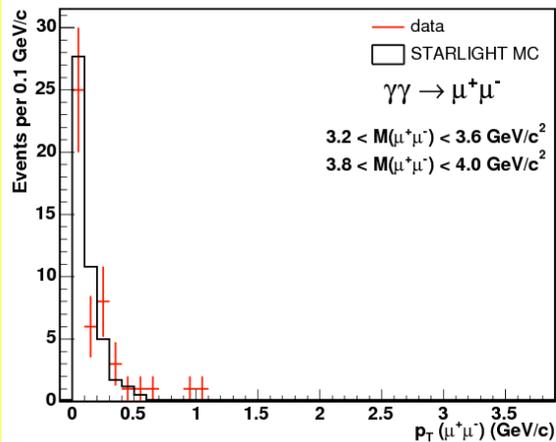

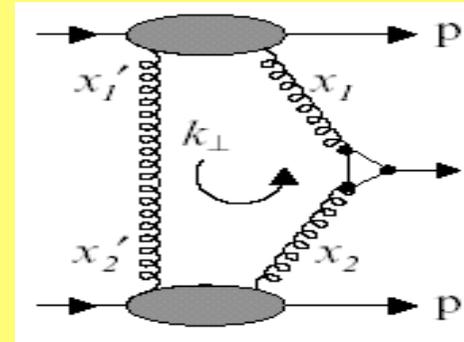

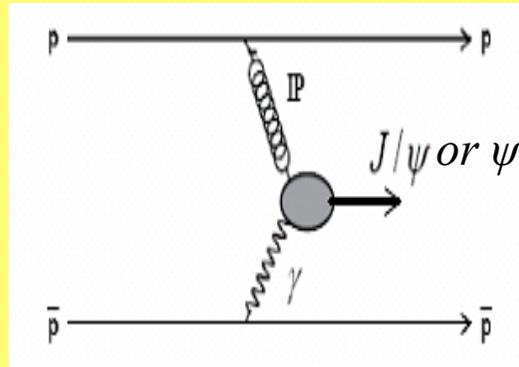

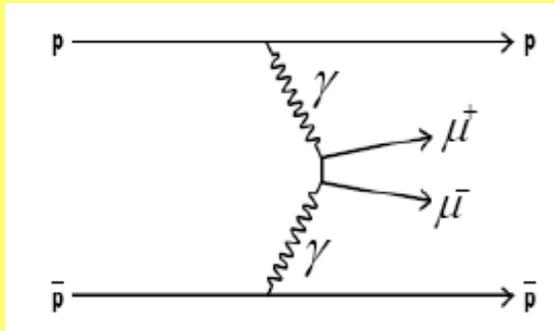

**Trigger:**  
One muon,  $p_T > 1.4 \text{ GeV}$   
Nothing in BSC

**Reconstruction:**  
Two central muons  
Nothing else or  
1 EM shower  $> 80 \text{ MeV}$

**BEYOND 3 deg:**  
**Luminosity Counters**  
**Beam Shower Counters**  
**Roman Pots**

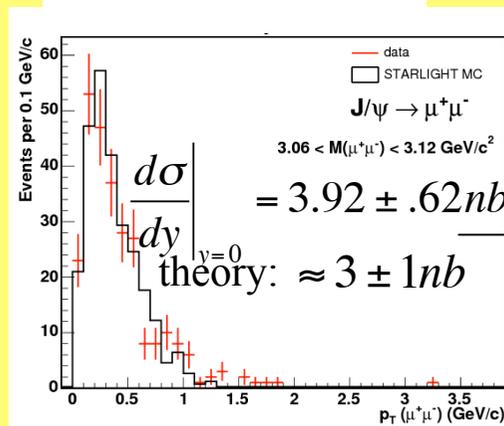

# Exclusive Dimuon Production

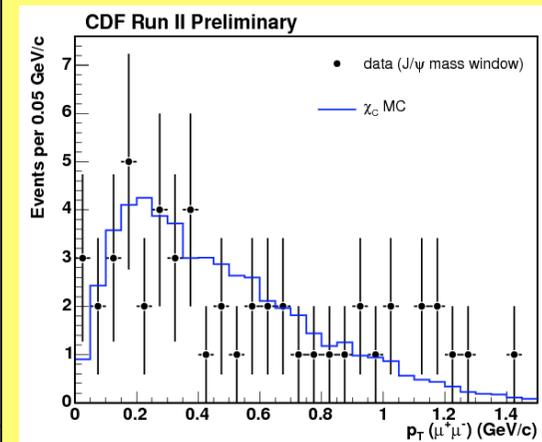

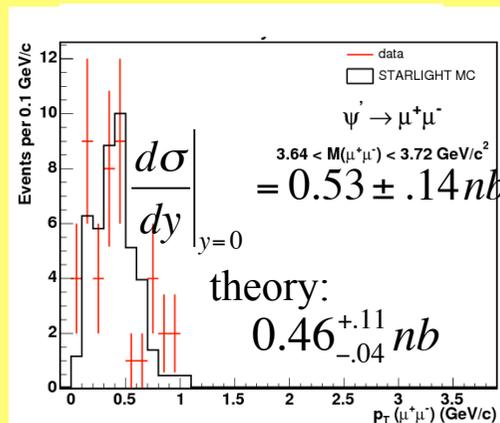

$\sigma = 2.7 \pm .5 \text{ nb}$

theory:  $\sigma = 2.18 \pm .01 \text{ nb}$

65 have photon too  
 $\frac{d\sigma}{dy} \Big|_{y=0} = 76 \pm 14 \text{ nb}$

consistent with theory

---

# Conclusions

- Jet cross-section measurements for CDF and D0 agree with each other and with NLO QCD
- Exclusive dimuons in the continuum are in agreement with QED
- Exclusive  $J/\psi$ ,  $\psi'$  and  $\chi_c$  have been observed.
